HTML Validator	One article heading warning addressed
CSS Validator	Three CSS Shapes errors remain
CSS-disabled reading order	**PASSED**
Long title and doubled paragraphs	**PASSED**
Sticky behavior	**PASSED**
Pointer activation	**PASSED**
Disabled CSS enhancements	**PASSED**
Stacking-context inspection	**PASSED**

CSS feature	How it is used in this project	Fallback behavior
display: grid	Creates the main two-column layout on wider screens.	The content remains in normal document flow if Grid is unsupported.
position: relative	Establishes positioning relationships for the feature header and pull quotes.	Elements remain visible in normal document flow.
position: absolute	Places the issue badge inside the feature header.	Without absolute positioning, the badge appears in normal document flow.
position: sticky	Keeps the story navigation visible while scrolling on wider screens.	Without sticky support, the navigation remains in normal document flow.
z-index	Controls the layering of the pull quotes using the raised layer token.	Without stacking support, elements follow the browser's normal painting order.
CSS custom properties (var())	Adding store reusable colors, spacing, typography, dimensions, and layer values.	A browser without custom property support will not apply on these variables.
clip-path	Uses inset(0 round 8px) to create subtly rounded food image corners.	The food image remains visible with square corners.
float	Allows text to flow beside the festival image.	Without the float, the image appears in normal document flow.
shape-outside	Uses circle to create circular text wrapping around the festival image.	Text wraps around the image's rectangular float instead.
shape-margin	Adds spacing between the circular text boundary and surrounding text.	Without this property, text may sit closer to the image.
@supports	Checks whether the browser supports shape-outside: circle before applying the circular wrapping enhancement.	The circular wrapping are skipped when the feature is unsupported.
Media queries (@media)	Adjust the layout, navigation, and text wrapping at different viewport widths.	Browsers without media query support use the base CSS rules.

AI Disclosure

In this project I used ChatGPT as my support system. The majority of the CSS and HTML coding was from past practice assignment knowledge. ChatGPT was used to assist in debugging issues relating to the sticky navigation and the layers of pull-quotes, which would allow the navigation bar not to overlap the quotes when scrolling. Additionally, ChatGPT was used to decode the CSS validation feedback messages and find research source links.

Code Defense

A selective CSS reset technique is utilized in place of deleting all the browser defaults. The universal selector and all its pseudo-elements have box-sizing: border-box property, meaning their padding and borders are accounted for. Some useful defaults and accessible aspects are left without being reset. Reusable values have been structured into CSS custom properties which consist of colors, spacing, typography, borders, and layering. It will help in designing consistently and easily changing elements. Tokens for layering create an obvious order which includes base (0), raised (10), sticky (20), and overlay (30). Theme-alt class has been used in order to change selected color tokens in only one area of a web page instead of changing colors across the whole page. Evidence-Based Revision: Scrolling tests revealed that the sticky story navigation was hiding the pull quotes. I deleted the navigation's z-index property to make sure the pull quotes will be higher than the navigation. I checked the web page and made sure that pull quotes can now be seen while scrolling.
